

Agricultural Energy Storage Project

Overview

What is an energy storage project?

An energy storage project is a cluster of battery banks (or modules) that are connected to the electrical grid. These battery banks are roughly the same size as a shipping container. These are also called Battery Energy Storage Systems (BESS), or grid-scale/utility-scale energy storage or battery storage systems.

Could agricultural reservoirs be connected to micro-pumped hydro energy storage systems?

The study, published today in *Applied Energy*, finds agricultural reservoirs, like those used for solar-power irrigation, could be connected to form micro-pumped hydro energy storage systems – household-size versions of the Snowy Hydro hydroelectric dam project.

Could Australia's farm dams be used to build small-scale hydro energy storage sites?

Photo: Getty Images. Tens of thousands of small-scale hydro energy storage sites could be built from Australia's farm dams, supporting the uptake of reliable, low-carbon power systems in rural communities, new UNSW-Sydney-led research suggests.

How much power can a micro-pumped hydro energy storage system provide?

The average site could provide up to 2 kW of power and 30 kWh of usable energy – enough to back up a South Australian home for 40 hours. “We identified tens of thousands of these potential sites where micro-pumped hydro energy storage systems could be installed without undertaking costly reservoir construction,” Dr Gilmore says.
