

Background of bifacial solar panels

Overview

Do bifacial solar panels increase power output?

Wei et al. reported that with diverse backgrounds, the power output gains of a bifacial module with an n-type PERT solar cell are almost 7.6% on grass, 15% on sand, and 29.2% on snow. Annual energy yield gain of bifacial east-west modules over south-oriented monofacial modules significantly improves with albedo in Amsterdam.

Why are bifacial solar panels becoming more popular?

In the solar PV industry, bifacial PV modules are becoming increasingly popular. This is because, when compared to monofacial PV modules, the module can absorb radiation on both sides of the panels to generate electricity, increasing the energy yield per square area.

Are bifacial solar panels better than monofacial?

Under better albedo and proper mounting angles, a typical bifacial solar panel is expected to show 50% more power conversion efficiency than the monofacial counterpart. Bifacial silicon solar cells are monofacial cells with a back surface opened with a dielectric passivated layer, and a polymer back cover is replaced with a transparent sheet.

What are bifacial solar panels?

The bifacial solar panels allow infrared radiation to pass through the surface due to high transparency; the operating temperature of the bifacial solar panels is at least 10 °C less than the monofacial solar panels. Eight types of bifacial solar panels are being commercialized and available in the market.
