# Is the battery BMS embedded

Overview

What is a battery management system (BMS)?

Cell balancing is another crucial BMS function is that it ensure that each cell in a battery pack charges and discharges uniformly, enhancing the battery's overall performance and durability. Modern rechargeable batteries' dependability and safety are maintained by this system's extensive monitoring, reporting, and protection functions.

What is a BMS used for?

BMSs are used in various applications, including Electric Vehicles (EVs), smartphones, renewable energy storage systems, and other devices powered by rechargeable batteries. The building unit of the battery system is called the battery cell. The battery cells are connected in series and in parallel to compose the battery module.

What is a BMS battery & how does it work?

These protections include over-current (OC), over-voltage (OV), under-voltage (UV), over-temperature (OT), and under-temperature (UT) conditions. The BMS guarantees the battery's longevity and safety by prohibiting it from running outside of its safe operating area (SOA).

What functionalities can be found in a battery management system (BMU)?

Some other functionalities that can be in the BMU are interlock functionality or the real time clock and vector management system for the software. BMS Software Architecture: The battery management system architecture has different layers that abstract different parts of hardware.
