

# **Is the electricity generated by the energy storage power station considered a power station**

## Overview

---

What is a power generating station?

A power generating station (also called a power plant or power station) is an industrial facility that converts primary energy —such as chemical energy in fuels, nuclear energy, or kinetic/thermal energy from nature—into electrical energy. The output is synchronized with the grid, stepped up in voltage, and transmitted to consumers.

What is an energy storage system?

An energy storage system (ESS) for electricity generation uses electricity (or some other energy source, such as solar-thermal energy) to charge an energy storage system or device, which is discharged to supply (generate) electricity when needed at desired levels and quality. ESSs provide a variety of services to support electric power grids.

What are battery storage power stations?

Battery storage power stations are usually composed of batteries, power conversion systems (inverters), control systems and monitoring equipment. There are a variety of battery types used, including lithium-ion, lead-acid, flow cell batteries, and others, depending on factors such as energy density, cycle life, and cost.

What is a power station?

This whole-of-facility view aligns with how technical references describe a power station as an industrial facility for the generation of electric power, also referred to as a power plant, generating station, or generating plant, with outputs generally connected to an electrical grid that distributes electricity to end users.
