Square wave energy storage power supply

Overview

Which power supply is best for insulating layers?

Since the introduction of dual-magnetron sputtering (DMS) for highly insulating layers, there is the choice between square wave pulse or sine wave power supplies.

How does a square wave generator work?

In DMS, the current path is perpendicular to the anode (right magnetron), through which the plasma is pushed towards the substrate. Sometimes it is argued that a square wave generator is the best choice for reactive sputtering, as it will deliver voltage, current and power at approximately 100% duty cycle during each half-wave.

What is the difference between a square wave generator and a sine wave generator?

Today, both types of generators are available in a wide power range and modern sine wave generators are equivalent to their square wave counterparts with respect to the arc management speed and low arc energies [3,4].

Are bipolar square wave generators more flexible than sine waves?

Even at an early time it has been argued that a bipolar square wave generator is more flexible with respect to symmetry and duty cycle, but that sine wave generators are easier to implement for high output powers.
