

**The larger the inverter is  
adjusted the lower the voltage  
will be**

## Overview

---

Why do inverters lose power?

This, though reducing the loss of downtime, will also cause loss of certain power generation capacity. Besides, efficiency loss. When the grid voltage rises, the DC bus voltage will also rise. For example, the DC bus voltage of the 400V AC voltage is around 610V. The rated voltage of the general inverters falls within the scope of the voltage.

What happens if a voltage rises in a general inverter?

Besides, efficiency loss. When the grid voltage rises, the DC bus voltage will also rise. For example, the DC bus voltage of the 400V AC voltage is around 610V. The rated voltage of the general inverters falls within the scope of the voltage. If the series voltage is around 600V, the PWM duty cycle is close to 1.

What happens if solar inverter voltage rises?

When the grid voltage rises to certain level, the inverter takes the initiative to reduce the power to prevent the solar inverter from being disconnected. This, though reducing the loss of downtime, will also cause loss of certain power generation capacity. Besides, efficiency loss. When the grid voltage rises, the DC bus voltage will also rise.

What are inverter settings?

Inverter Settings 1. To set output voltage of inverter - This is normally 230 Vac. Possible values 210V ~ 245V. 2. Used to enable/disable the internal ground relay functionality. Connection between N and PE during inverter operation. - The ground relay is useful when an earth-leakage circuit-breaker is part of the installation.

## The larger the inverter is adjusted the lower the voltage will be
