

UK Manchester power frequency power UPS uninterruptible power supply

Overview

What is an uninterruptible power supply (UPS)?

An uninterruptible power supply or UPS protects hardware such as computers, data centres, telecommunication equipment or other electrical equipment, where an unexpected power disturbance could cause serious business disruption or data loss.

How important are uninterruptible power supplies?

At Vital Power we fully understand and appreciate how important uninterruptible power supplies (UPS) are in supporting critical electrical infrastructure. Emergency power is what keeps businesses online and up and running when there's a power failure from an outage, weather event or other issue.

When should you use an ups device?

It can also be used on occasions when the voltage to your business drops below an acceptable level to keep sensitive equipment online. Think of a UPS device as a form of power protection for your business. Using an uninterrupted power supply means you can keep your devices running for a short time until power is restored.

Why should a business use an ups?

Or, a UPS can ensure that your business computers, equipment and other electronics can be safely shut down, without catastrophic failure from power interruption or power surges. Uninterruptible power supplies can be used for a variety of businesses to provide backup power if there's an outage.
