

Urban solar grid-connected inverter

Overview

What is a grid-connected inverter?

The grid-connected inverter, which transforms DC power produced by PV panels into grid-compatible AC power, is a crucial part of this integration. The design and control of a single-stage PV grid-connected inverter are approached creatively in this work, focusing on enhancing efficiency, reliability, and grid compliance.

What is the control design of a grid connected inverter?

The control design of this type of inverter may be challenging as several algorithms are required to run the inverter. This reference design uses the C2000 microcontroller (MCU) family of devices to implement control of a grid connected inverter with output current control.

How do inverters provide grid services?

In order to provide grid services, inverters need to have sources of power that they can control. This could be either generation, such as a solar panel that is currently producing electricity, or storage, like a battery system that can be used to provide power that was previously stored.

What is solar inverter based generation?

As more solar systems are added to the grid, more inverters are being connected to the grid than ever before. Inverter-based generation can produce energy at any frequency and does not have the same inertial properties as steam-based generation, because there is no turbine involved.
